# PROJECT RESPONSIBILITIES

- Team Lead: Jor-El Sanchez
- Frontend Developer: Omar Benavidez
- Backend Developer: Karandeep Gill
- Database Administrator: David Patterson

# TASK

- Our team is to build a website for a client looking to expand their business into the online market. The website is to list various products that the business sells via picture and description.

# PROBLEM

- Currently, the client does not have a website or webpage for their business.
- The client would like the website to utilize social media to communicate with customers, spread word of their business, as well as offer deals.
- The website would need to be search engine optimized.
- The client will also need a database for their growing business. This database will keep track of items, orders, prices, and descriptions. The database will allow for products to be searched by genre and artist name.

# SOLUTION TO PROBLEM

- Create a website for Neptune Records
- Website that will consist of:
  - Link to their Facebook page
  - Link to their Instagram page
  - Information about the music store and how it was started
  - Gallery of rare records and new/up and coming records
  - A feature through which clients can send email to customer service
  - A page for past events and upcoming events
